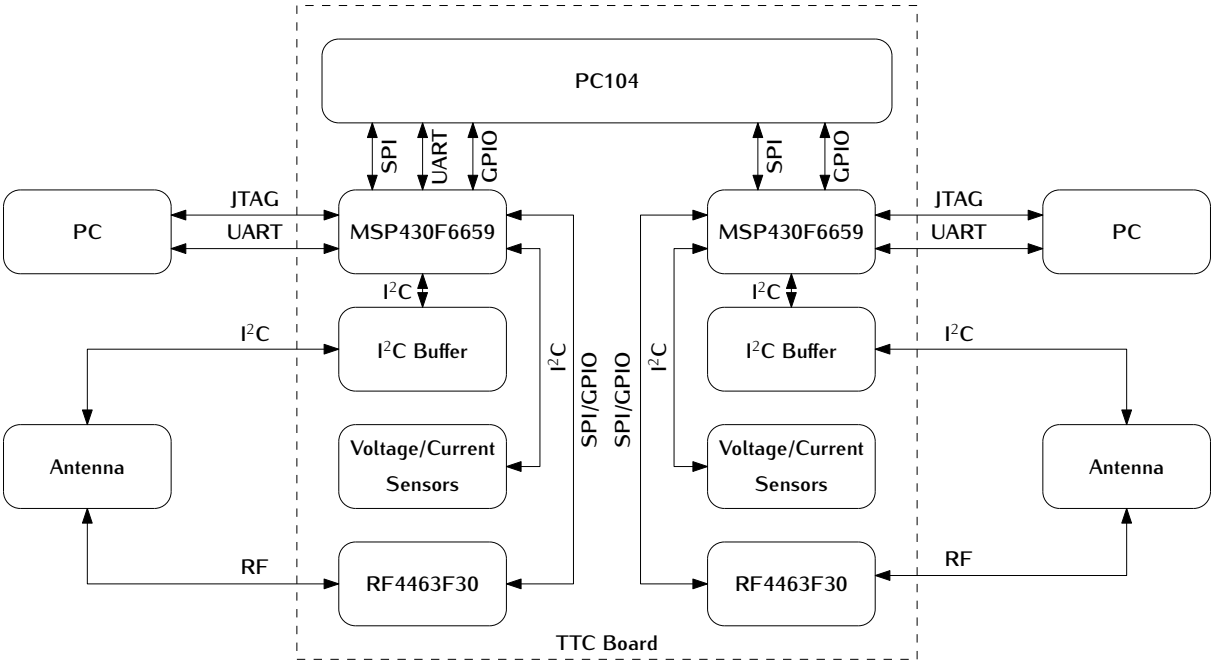

Figure 2.1: Block diagram of the TTC 2 hardware.

2.1 PC-104

The connector referred as PC-104 is a junction of two double row 26 pin headers (*SSW-126-04-G-D*). These connectors create a solid 104-pin interconnection across the different satellite modules. Table 2.1 provides the connector pinout[1] for the pins that are connected to the module. A reference of the pins' position can also be seen in Figure 2.2, a description of the signal is available in Table 2.2.

The distribution pattern of pins adopted in this project is a mix of multiple different patterns from CubeSat modules manufacturers, like GomSpace, ISIS and Endurosat. Some pins are positioned to attend specific project requirements, and it is possible that the adopted pattern is not totally compatible to some commercial modules.

[1]This pinout is simplified since additional interfaces were omitted. Refer to *option sheet* in chapter ??.

3.1 Variables and Parameters

A list of all the variables of TTC with their identification number (ID) and variable type that can be read from the sensors and peripherals is seen in the Table 3.1.

ID	Name/Description	Type	Access
0	Device ID (0xCC2A or 0xCC2B)	uint16	R
1	Hardware version	uint8	R
2	Firmware version (ex.: "v1.2.3"' = 0x00010203)	uint32	R
3	Time counter in millseconds	uint32	R
4	Reset counter	uint16	R
5	Last reset cause: - 0x00 = No interrupt pending - 0x02 = Brownout (BOR) - 0x04 = RST/NMI (BOR) - 0x06 = PMMSWBOR (BOR) - 0x08 = Wakeup from LPMx.5 (BOR) - 0x0A = Security violation (BOR) - 0x0C = SVSL (POR) - 0x0E = SVSH (POR) - 0x10 = SVML_OVP (POR) - 0x12 = SVMH_OVP (POR) - 0x14 = PMMSWPOR (POR) - 0x16 = WDT time out (PUC) - 0x18 = WDT password violation (PUC) - 0x1A = Flash password violation (PUC) - 0x1C = Reserved - 0x1E = PERF peripheral/configuration area fetch (PUC) - 0x20 = PMM password violation (PUC) - 0x22 to 0x3E = Reserved	uint8	R
6	Input voltage of the μC in mV	uint16	R
7	Input current of the μC in mA	uint16	R
8	Temperature of the μC in K	uint16	R
9	Input voltage of the radio in mV	uint16	R

10	Input current of the radio in mA	uint16	R
11	Temperature of the radio in K	uint16	R
12	Last valid command (uplink packet ID)	uint8	R
13	RSSI of the last valid telecommand	uint16	R
14	Temperature of the antenna module in K	uint16	R
15	Antenna module status bits: - Bit 15: The antenna 1 is deployed (0) or not (1) - Bit 14: Cause of the latest activation stop for antenna 1 - Bit 13: The antenna 1 deployment is active (1) or not (0) - Bit 11: The antenna 2 is deployed (0) or not (1) - Bit 10: Cause of the latest activation stop for antenna 2 - Bit 9: The antenna 2 deployment is active (1) or not (0) - Bit 8: The antenna is ignoring the deployment switches (1) or not (0) - Bit 7: The antenna 3 is deployed (0) or not (1) - Bit 6: Cause of the latest activation stop for antenna 3 - Bit 5: The antenna 3 deployment is active (1) or not (0) - Bit 4: The antenna system independent burn is active (1) or not (0) - Bit 3: The antenna 4 is deployed (0) or not (1) - Bit 2: Cause of the latest activation stop for antenna 4 - Bit 1: The antenna 4 deployment is active (1) or not (0) - Bit 0: The antenna system is armed (1) or not (0)	uint16	R
16	Antenna deployment status (0=never executed, 1=executed)	uint8	R
17	Antenna deployment hibernation (0=never executed, 1=executed)	uint8	R
18	TX packet counter	uint32	R
19	RX packet counter (valid packets)	uint32	R
